Mac OS X: I upgraded to OSX 10.5, how can I have CGoban back ?

You can first try to reinstall the software, by clicking the "cgoban3 with java web start" link on the [KGS download page](#).

In case it fails, you'll have to uninstall the software manually and reinstall it afterwards.
- Open the Finder
- Click on Applications
- Open the folder Utilities
- Open the folder Java
- Run Java Web Start
- Select CGoban 3 in the applications list
- Click on "remove selected application"

Then reinstall by clicking the "cgoban3 with java web start" link on the [KGS download page](#). This should fix the issue.
