*Mac OS X: After a java update, the name of the application CGoban 3 is replaced by com.sun.javaws.com, how can I restore it?*

Mac OS X users, if after a java update, the name of the application CGoban 3 is replaced by com.sun.javaws.com, while opening a new icon in the dock, you can go back to the usual situation like this:

- Go to Applications/Utilities/Java and launch Java Web Start.
- The list of your applications that use Java Web Start appears. Select CGoban 3 (it may already be selected). Click then on the arrow at the top of the window, to install a new shortcut to CGoban 3 (you can put it in your dock, if you like).
-  From now on, launch CGoban 3 with this new shortcut (you can trash the old one).
