

Windows: When I try to open CGoban 3, I see Java starting logo then shows Application Error: "Unable to launch the application.", what can I do?

It has been reported from several java 6 users.

If you open "more details information", it shows something like:

*Error: Could not load file/URL specified: C:\Documents and Settings****\Application Data\Sun\Java\Deployment\cache\6.0*********

This is a bug in java 6 mentionned in [their site](#).

While we are waiting for a fix, you can try [uninstalling](#) the client CGoban3 then reinstalling it with the "cgoban3 with java web start" link in the [KGS download page](#). It should fix the problem.
